

SMIT
MOBILE EQUIPMENT B.V.

Mobile Primary Healthcare Solutions

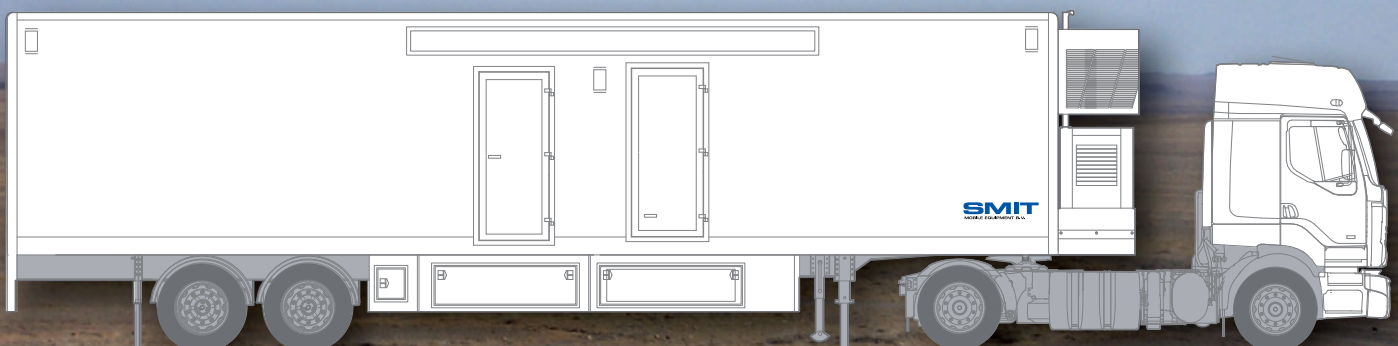

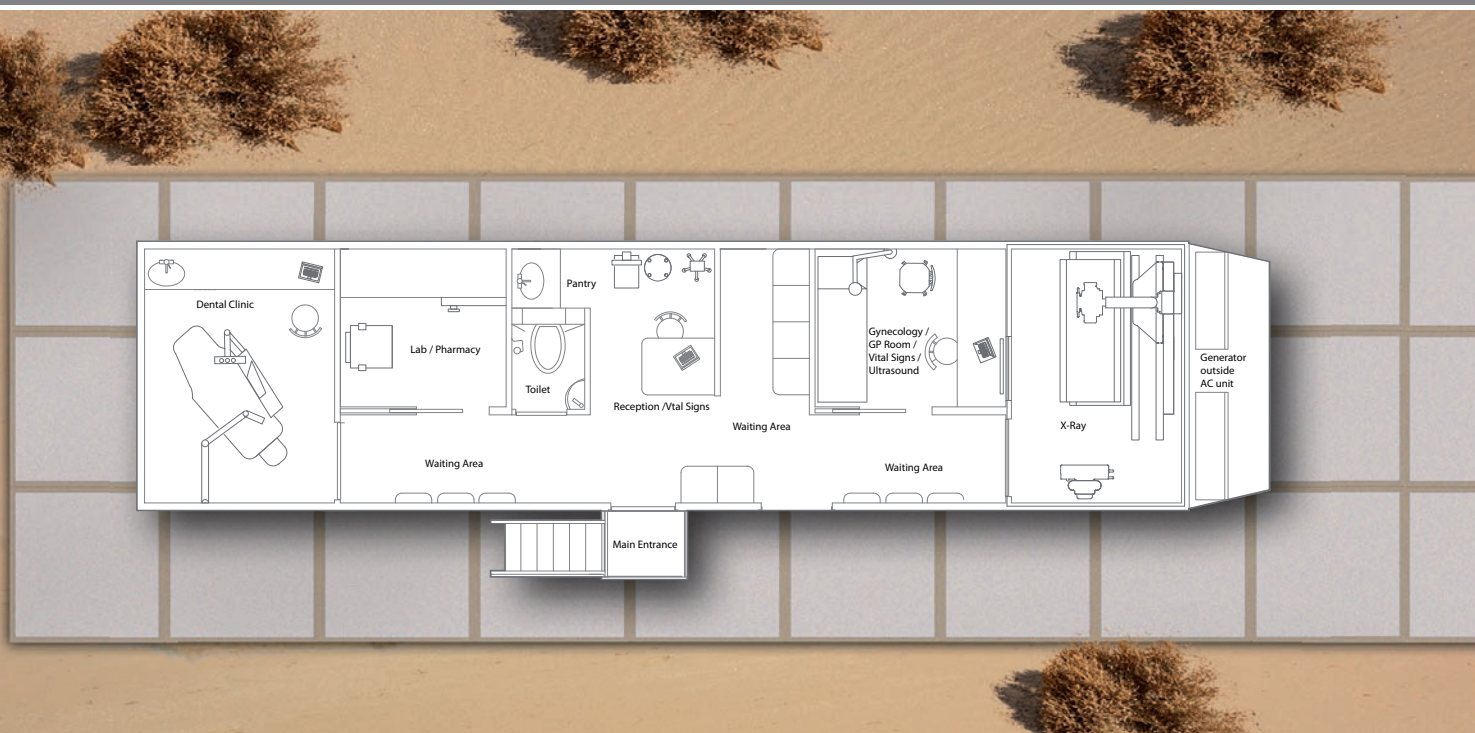

supporting rural areas

Smit Mobile Equipment introduces a unique new solution to provide primary healthcare to rural areas. The solution consists of mobile units, designed so that professionals can execute a wide range of medical procedures and treatments anywhere in the country. Smit offers three solutions, each solution being especially designed to meet the requirements to reach out to the people living in rural areas.

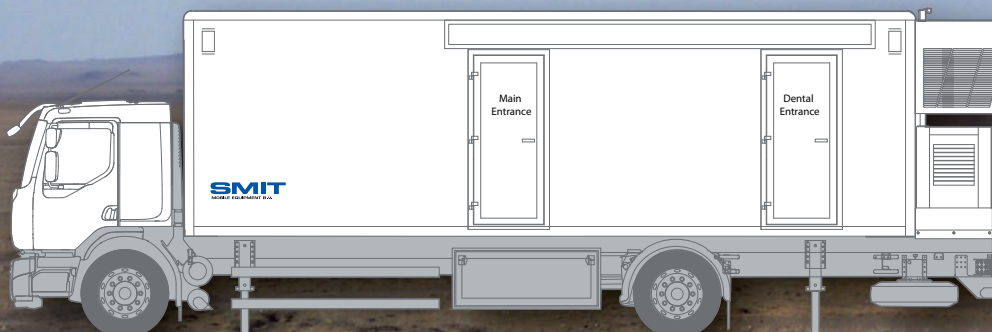

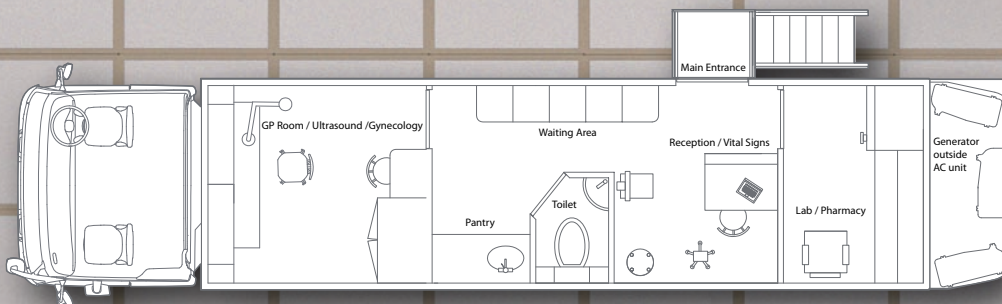

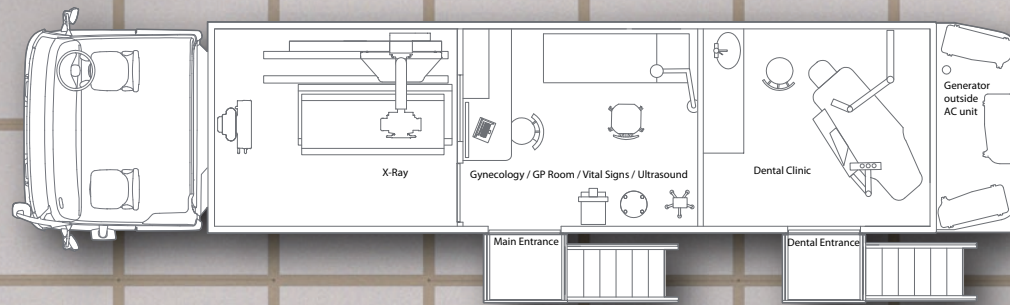

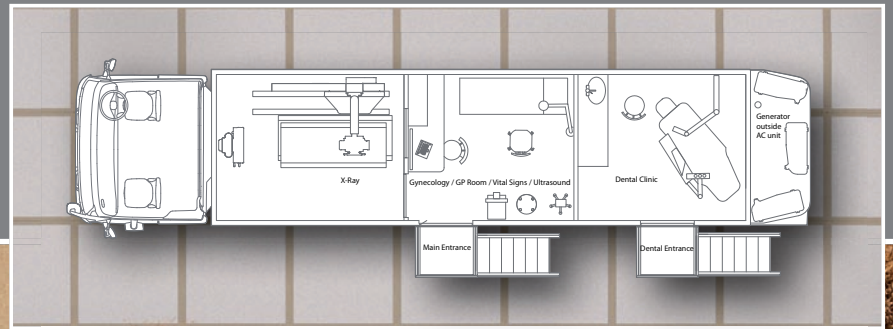

Type I

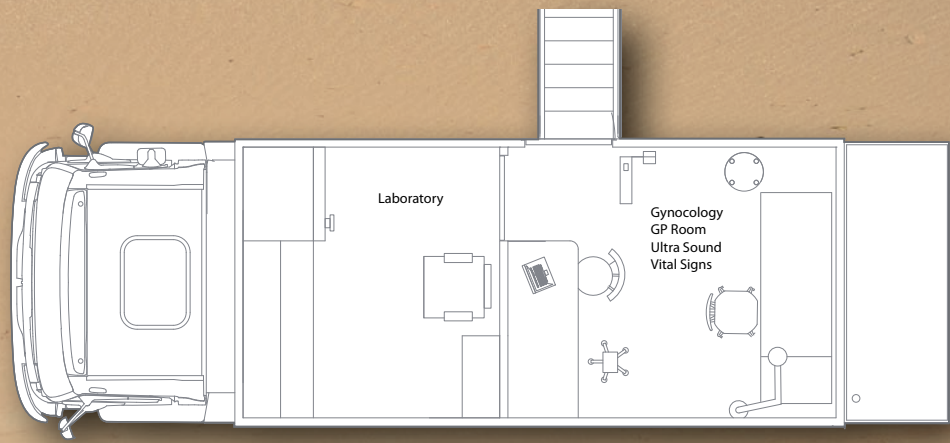

A large trailer, designed for professionals to provide a maximum number of medical treatments including X-rays, dental practice, GP rooms, gynaecology and ultrasound, monitoring vital signs, laboratory and pharmacy. Furthermore the design includes staff facilities such as a pantry, toilet and a reception with waiting area. The trailer design includes a complete water system, hydraulic levelling supports, self-supporting generator, upgraded AC system and a customised chassis with two heavy duty axles. The trailer is designed to be hauled by a separate tractor head.

Type II

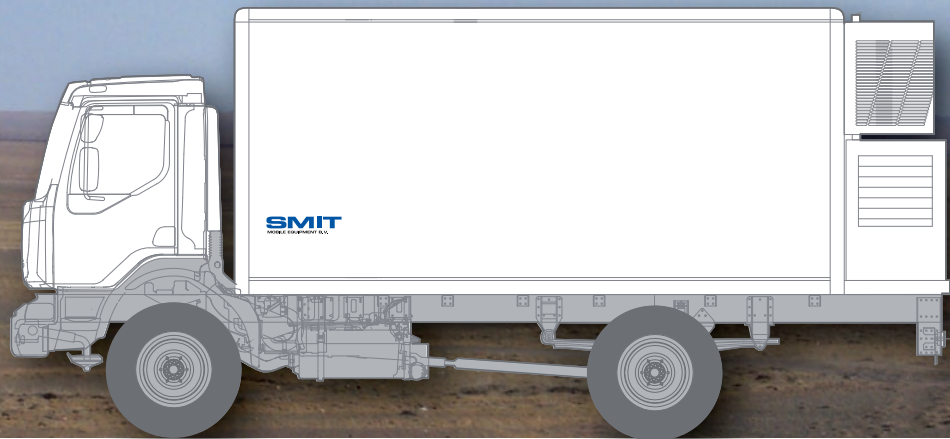

A medium-sized self-propelled unit designed for off-road terrain so that even people living in remote rural areas can be reached. The solution is based on a chassis that meets all the requirements to go off-road. There are two variants of the Type II solution. Together they enable professionals to provide a full range of medical procedures and treatments including X-rays, dental practice, GP rooms, gynaecology and ultrasound, monitoring vital signs, laboratory and pharmacy. Furthermore the design includes staff facilities such as a pantry, toilet and a reception with waiting area in one unit. The chassis design includes a complete water system, hydraulic levelling supports, self-supporting generator, upgraded AC system and a customised chassis with heavy duty axles.

Type III

This special mobile unit is designed to bring medical care to people living in extremely remote areas. It is built to traverse difficult unpaved roads, fords and mountain tracks. The solution is based on a special 4x4 chassis with a unique sub-frame construction that enables the unit to cross rough terrain without damaging the valuable equipment on board. The interior fittings include a laboratory with pharmacy and a GP room for gynaecology, ultrasound examinations and monitoring vital signs. Furthermore the unit comes with a self-supporting generator and upgraded AC system.
